THE WORD PROBLEM FOR HYPERBOLIC GROUPS

Tyler Taylor, Montana Tech at University on Montana, Butte
Atish Mitra, Mathematics Department, Montana Tech at University on Montana, Butte

Max Dehn's word problem asks us the following: Given a finitely generated group in terms of generators and relations, is there an algorithmic procedure to determine if an arbitrary word represents the identity element? In this undergraduate research project, we define the notion of hyperbolicity of a metric space and present a geometric proof that all hyperbolic groups have solvable word problems.
